OUTLINE

- **OIL SPILL AND ITS TYPES**
- **OIL SPILL PRONE ZONES**
- **SOURCES OF OIL SPILLS AND ICG STATISTICS**
- **OIL WEATHERING PROCESS**
- **ENVIRONMENTAL IMPACTS OF OIL SPILLS**
- **NEED FOR OIL SPILL TRAJECTORY PREDICTION SYSTEM**
- **OIL SPILL MODELING AND TRAJECTORY FORECASTING SYSTEM AT INCOIS WITH CASE STUDY**

OIL SPILL AND ITS TYPES

WHAT IS AN OIL SPILL

- Release of liquid petroleum hydrocarbon into land /water body
- Form of water pollution

TYPES OF SPILL

Tier -1 < 7 Tonnes

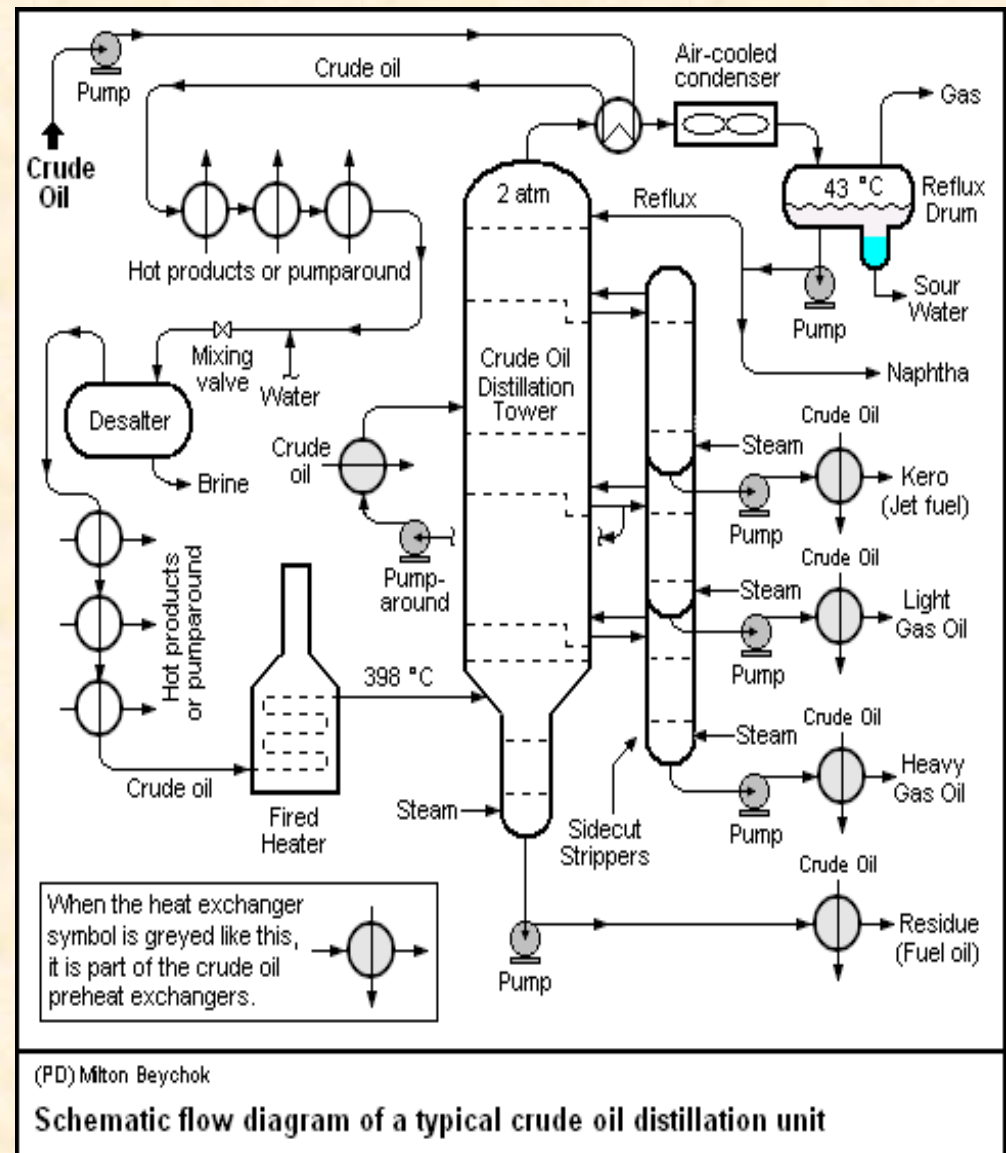

Tier -2 >7 <700 Tonnes

Tier - 3 > 700 Tonnes

CRUDE OIL AND ITS PRODUCTS

Crude oil, is a naturally occurring, flammable and usually dark brown or greenish colored liquid found primarily in underground geological formations. Crude oil consists of a complex mixture of hydrocarbons of various molecular weights plus other chemical compounds.

BP DEEPWATER HORIZON ACCIDENT INVESTIGATION REPORT

<http://www.nola.com/news/gulf-oil-spill/deepwater-disaster/index.ssf>

DEEPWATER HORIZON BLOWOUT/CLEAN UP METHODS

- Between April 20, 2010 and July 15, 2010 approximately 20,58,00,000 gallons of oil leaked into the Gulf of Mexico.
- The blowout is at a depth of 5,000ft (one mile below the surface of the ocean). Most of the oil rises to the surface because oil is less dense than water.
- Some of the oil gets trapped in underwater currents and can travel throughout the ocean.
- Dispersants (Corexit) to improve the separation of particles and to prevent settling or clumping,
- Booms are the temporary floating barrier used to contain an oil spill
- Absorbents are materials that pick up and retain liquid causing the material to swell (saw dust, straw) sorbents need to be both oleophilic (oil-attracting) and hydrophobic (water-repellent).

ICG STATISTICS ON INDIAN SCENARIO

OIL SPILLS DUE TO TYPE OF ACCIDENTS

OIL SPILLS ALONG THE COASTAL ZONES

OIL WEATHERING PROCESS

OIL WEATHERING

Oil weathering is defined as the process that makes changes in chemical composition and physical characteristics over time.

Soon after an oil spill incident, the following process will happen

- Emulsion (water in oil)
- Dispersion (Oil in water)
- Evaporation
- Spreading
- Adsorption
- Drifting

ENVIRONMENTAL IMPACTS OF OIL SPILLS

IMPACT ON PHOTOSYNTHESIS IN THE MARINE ENVIRONMENT

Phytoplankton can only carry out this process where there is sufficient light intensity penetrating the sea water. This area is called the **photic zone** and is often the top 100 metres of the ocean.

Heavier oils will cover the surface, thereby not allowing the sunlight to penetrate.

IMPACT OF OIL ON FAUNA

Birds

- Loss of insulating properties
- Loss of immunity
- Inhalation of toxic volatile hydrocarbons

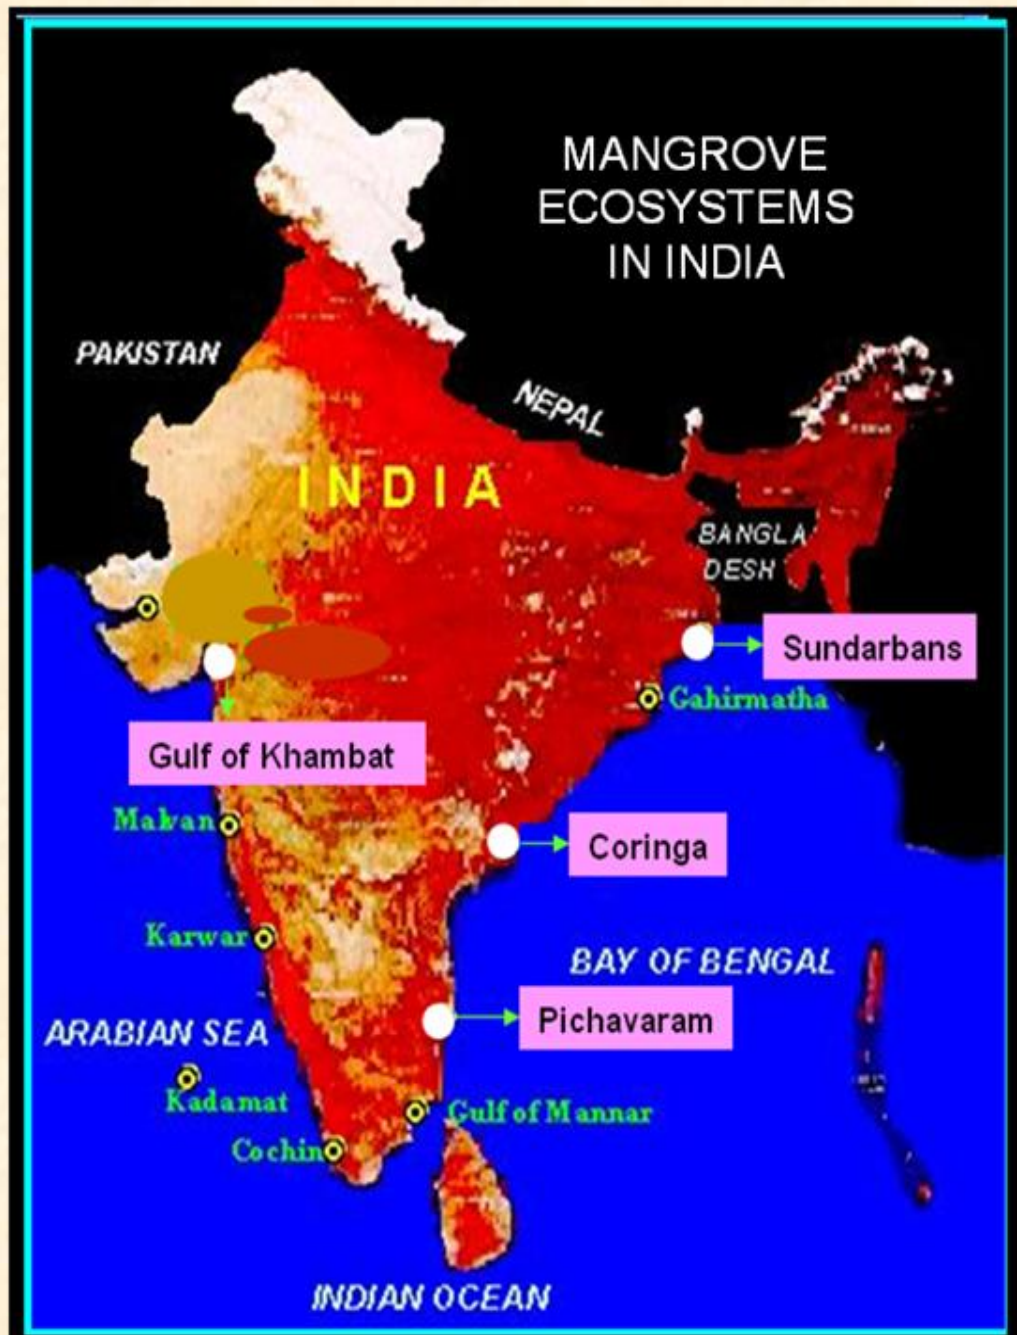

IMPACT OF OIL ON FISHERIES

- Loss of breeding habitats
- Accumulation of toxins
- Poor taste

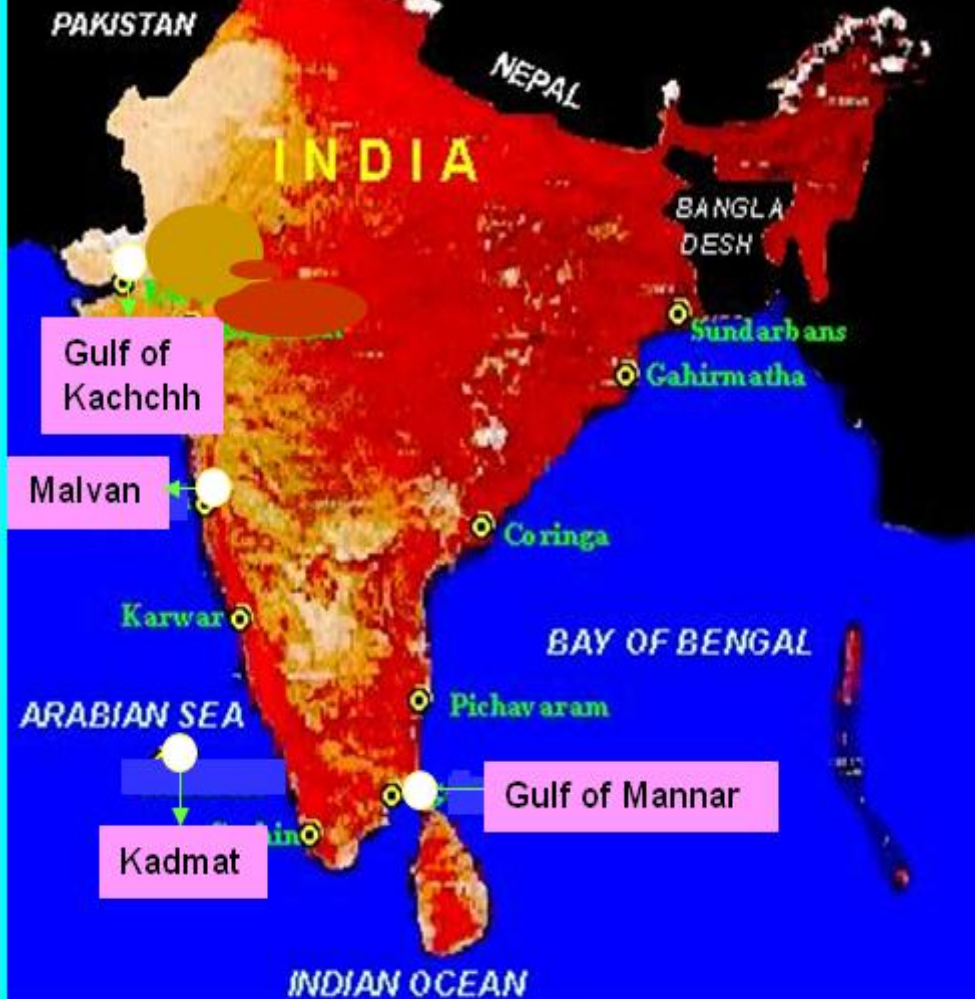

IMPACT OF OIL IN MANGROVES

- Light fuels oils can cause mortality in 24-48 hours in red mangroves and black mangroves.
- Crude oils – coat the prop roots and reduce the ability to exchange gases.
- Long term persistence – cause leaf loss and to death.

CORAL REEF ECOSYSTEM IN INDIA

SIGNIFICANCE OF CORAL REEFS

- Coral reefs - natural barriers that protect nearby shorelines from the eroding forces of the sea,
- Coral reefs cover less than 1% of the Earth's surface, they are home to 25% of all marine fish species.

IMPACT OF OIL IN CORAL REEFS

- Effect the health of the larger reef community
- Some of the more territorial fish will even remain in the area until death.

NEED FOR OIL SPILL TRAJECTORY PREDICTION SYSTEM

INCOIS AID IN OIL SPILL PREPAREDNESS AND RESPONSE

DISSEMINATION OF OIL SPILL ADVISORY TO THE USERS

SIGNIFICANCE OF OIL SPILL TRAJECTORY PREDICTION

India possessing sensitive ecosystems and aquatic organisms along its coastline comprising estuaries, lagoons, mangroves, backwaters, salt marshes, mudflats, rocky shores, sandy structures and known for its coastal and Marine biodiversity. The marine habitats are being affected due to the oil spills caused due to vessel collisions and illegal discharges. In order to prevent the impact of oil spills on the marine environment an oil spill trajectory prediction system is required, to provide the trajectory of an oil spill thereby protecting the Marine habitats.

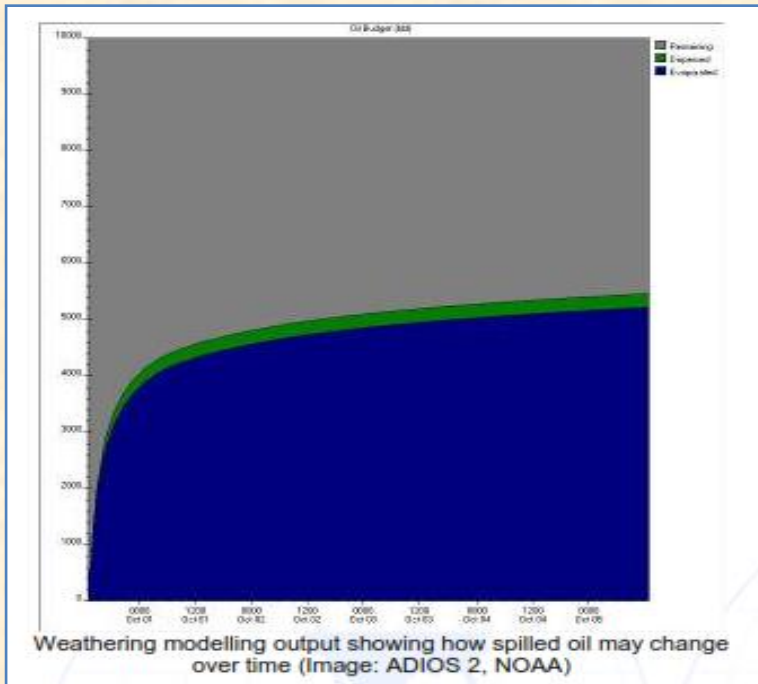

In the event of oil spill, the direction and movement of the oil will be predicted in advance in our system and will be disseminated to the Regulatory Authority. The clean up and control measures will be planned and carried out accordingly.

OIL WEATHERING AND TRAJECTORY

MODELING

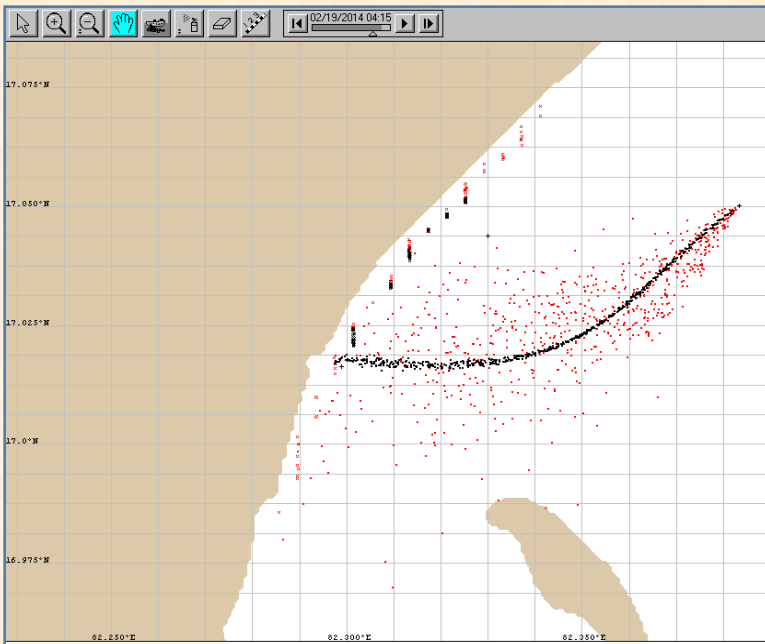

WEATHERING MODELS – Predicts the changes in the oil characteristics with respect to the time.

TRAJECTORY MODELS - Predicts the path of the spilled oil with respect to the time

USES OF OIL SPILL MODELS

1. Contingency planning - to protect the marine organisms
2. Mock drills/ exercise - conducted by various offshore industries as a part of regulations
3. Oil spill response operations - to issue the advisory in the event of oil spills.

SALIENT FEATURES OF THIS SYSTEM

1. INCOIS being the first organization in India to initiate/issue Online Oil Spill Advisory to their users.
2. Users can submit their request online
3. Moreover they themselves can trigger the model and get the output.
4. The predicted trajectory will be generated immediately and will be disseminated to their emails.
5. The trajectory will sent in a Movie(.mov) format, so that the users by playing the movie, will come to know the respective places of oil drift.
6. This system will also eliminate the telephonic and fax traffic during emergency situations.

OIL SPILL TRAJECTORY PREDICTION-METHODOLOGY

METHODOLOGY

DESCRIPTION

➤ GNOME, an oil spill trajectory model developed by NOAA is used in this prediction system.

➤ The details such as time, date, location, type and quantity of the oil spilled will be obtained the Regulatory authority / users. The major forcings like ECMWF winds and ROMS currents are the driving parameters.

➤ The predicted trajectory will be disseminated to the users in movie, image and text formats.

➤ The available SAR data will be subjected to oil spill detection

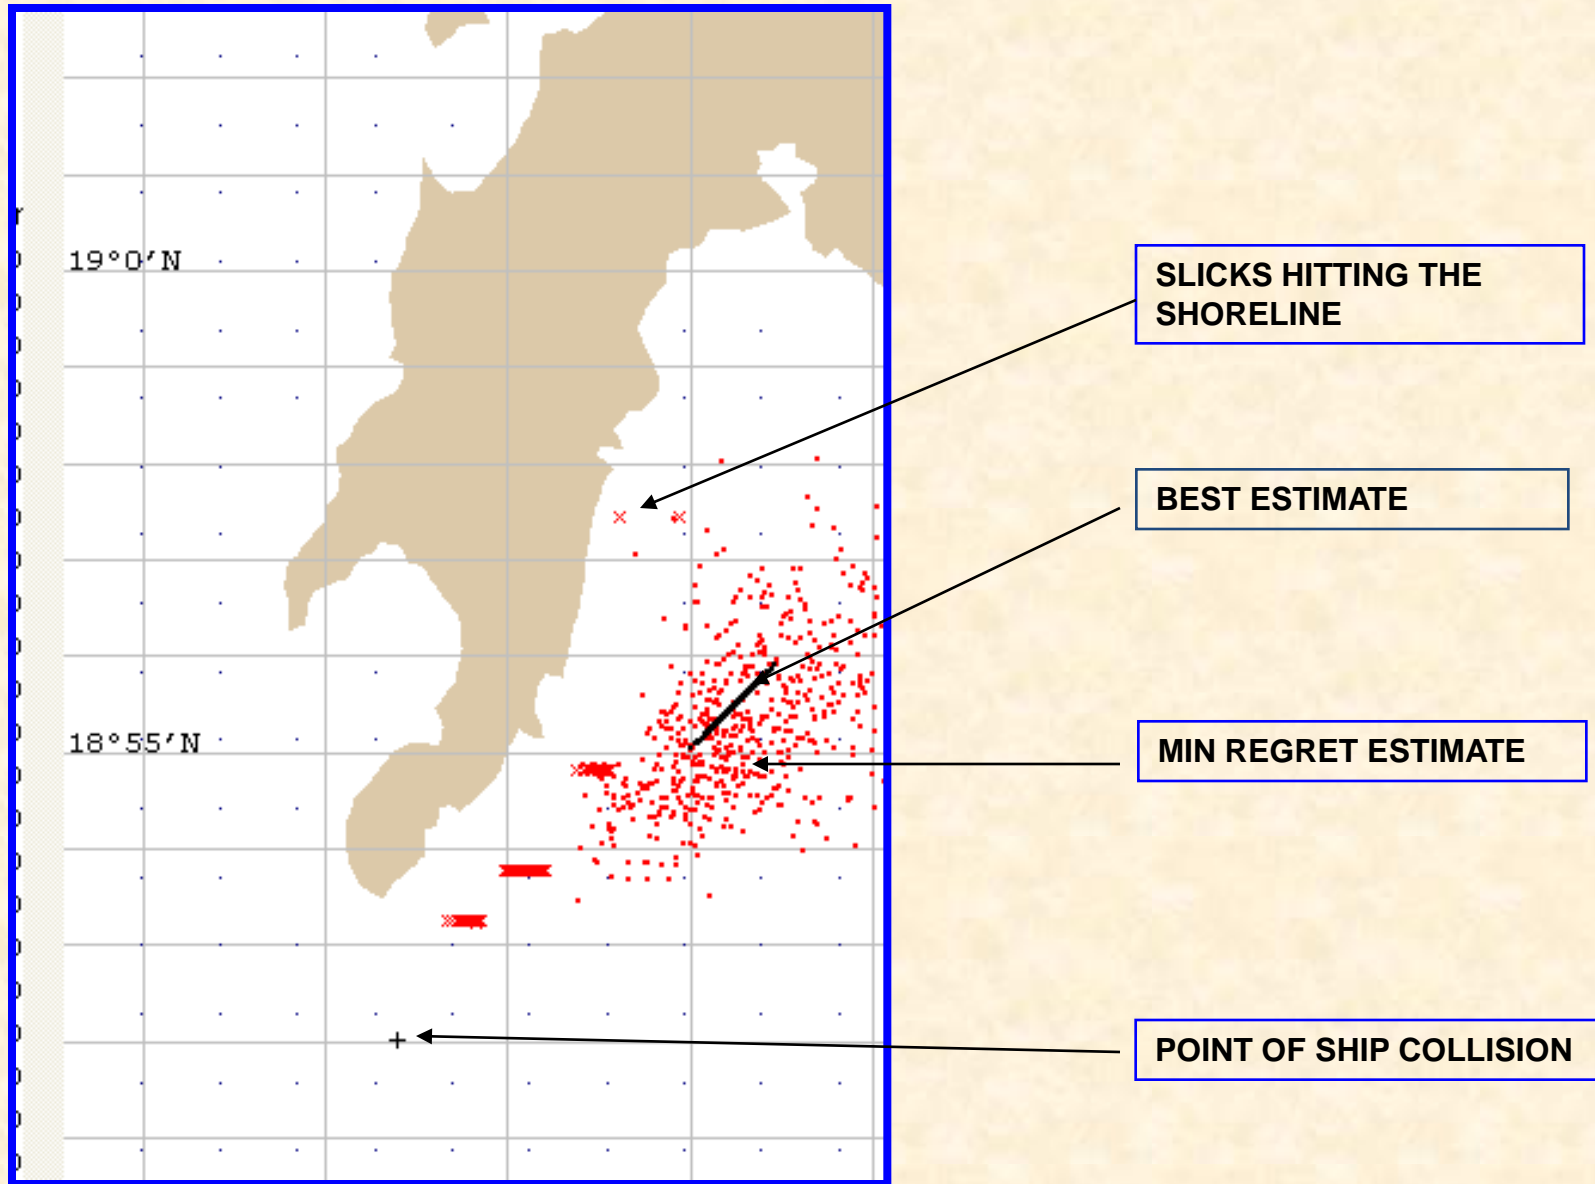

➤ Both the observed and the predicted trajectory will be compared in a common platform.

GNOME- (General NOAA Operational Modeling Environment)

- GNOME was developed by the Emergency Response Division of NOAA's Office of Response and Restoration.
- First release - March, 1999 ,Recent version - GNOME 1.3.8 - Jan 2014
- Predict how wind, currents, and other processes might move and spread oil spilled on the water.
- It gives the best estimate (black color) and Minimum regret estimates (red color) of spill trajectories.

MAGNIFICATION OF THE OUTPUT IMAGE

Every LE/spill dots indicates

- Position in Lon, ,lat (degrees)
- Time of release (seconds)
- Status of the particle with time.
- Pollutant type
- Mass of the pollutant(grams)
- Age – time since release (seconds)

Types of release

- One time/ instantaneous
- Continuous

CASE STUDY

OIL SPILLS IN INDIAN WATERS

MV RAK SPILL_ 06.08.2011 AT BOMBAY HIGH

Shri N V Vardan Kumar
Shri Harish Chandra P
Shri Mohammad Yaseen

SUSPECTED FUEL OIL SPILL DUE TO MV MOL COMFORT SUNK

INCOIS aid for Search And Rescue (SAR) Operations during Oct 2013

Model is forced with forecasted wind and current.

Black dots indicate best estimate and red dots estimate with 10 % uncertainty.

18 crew members found on
14.10.2013, 06:45 hrs, Near
swarnarekha river mouth,
 $21^{\circ}33'48''\text{N}, 87^{\circ}24'0''\text{E}$
Deviation of 14.5 km from
prediction

Life raft found on
13.10.2013, 16:38 hrs
Near Digga Mohan,
 $21^{\circ}38'20.1''\text{N}, 87^{\circ}31'8.5''\text{E}$,
Deviation of 3.5 km from
prediction.

Forecasted path for the search
and rescue of life raft missing
from MV Bingo sank off Sagar
Islands on 12 October 2013

Location of MV BINGO
sunk on
12.10.2013, 13:30 hrs :
 $21^{\circ}13.49'\text{N}, 88^{\circ}13.27'\text{E}$

Oil Spill Response – Mock Drill

18th February-2014

(Level - I)

Oil Spill Response – Vessels deployed

Oil Spill Response Exercise was carried out on 18th Feb-2014 at Outer Anchorage Area, Kakinada Sea Port from **08:25 to 14:30 hrs.**

Following Vessel Involved in Exercise:

- Lewek Harrier - AHTS (RIL Charter Hire Vessel)
- Jala Hamsa– TUG (KSPL Vessel)
- SMS Able – Security Vessel

Lewek Harrier

Jala Hamsa

SMS Able

Pollution Response Team – 16 members

Oil Spill trajectory modeling

Oil Spill trajectory modeling was carried out with the support from Indian National Centre for Ocean Information Services (INCOIS).

- INCOIS provided direction of the spill based on the weather conditions from the spilled locations. Following details were provided to INCOIS:
- Location of Spill: Lat. 17 degrees 03 min North,
Long 82 degrees 23 min East

Oil Spill Trajectory predicted by INCOIS

Boom Inflation and Boom Towing operation in progress

J-Shape formation to contain Oil Spill from SMS Able

KG D6
Exploration & Production

**SMS Able
(Grounded
Vessel)**

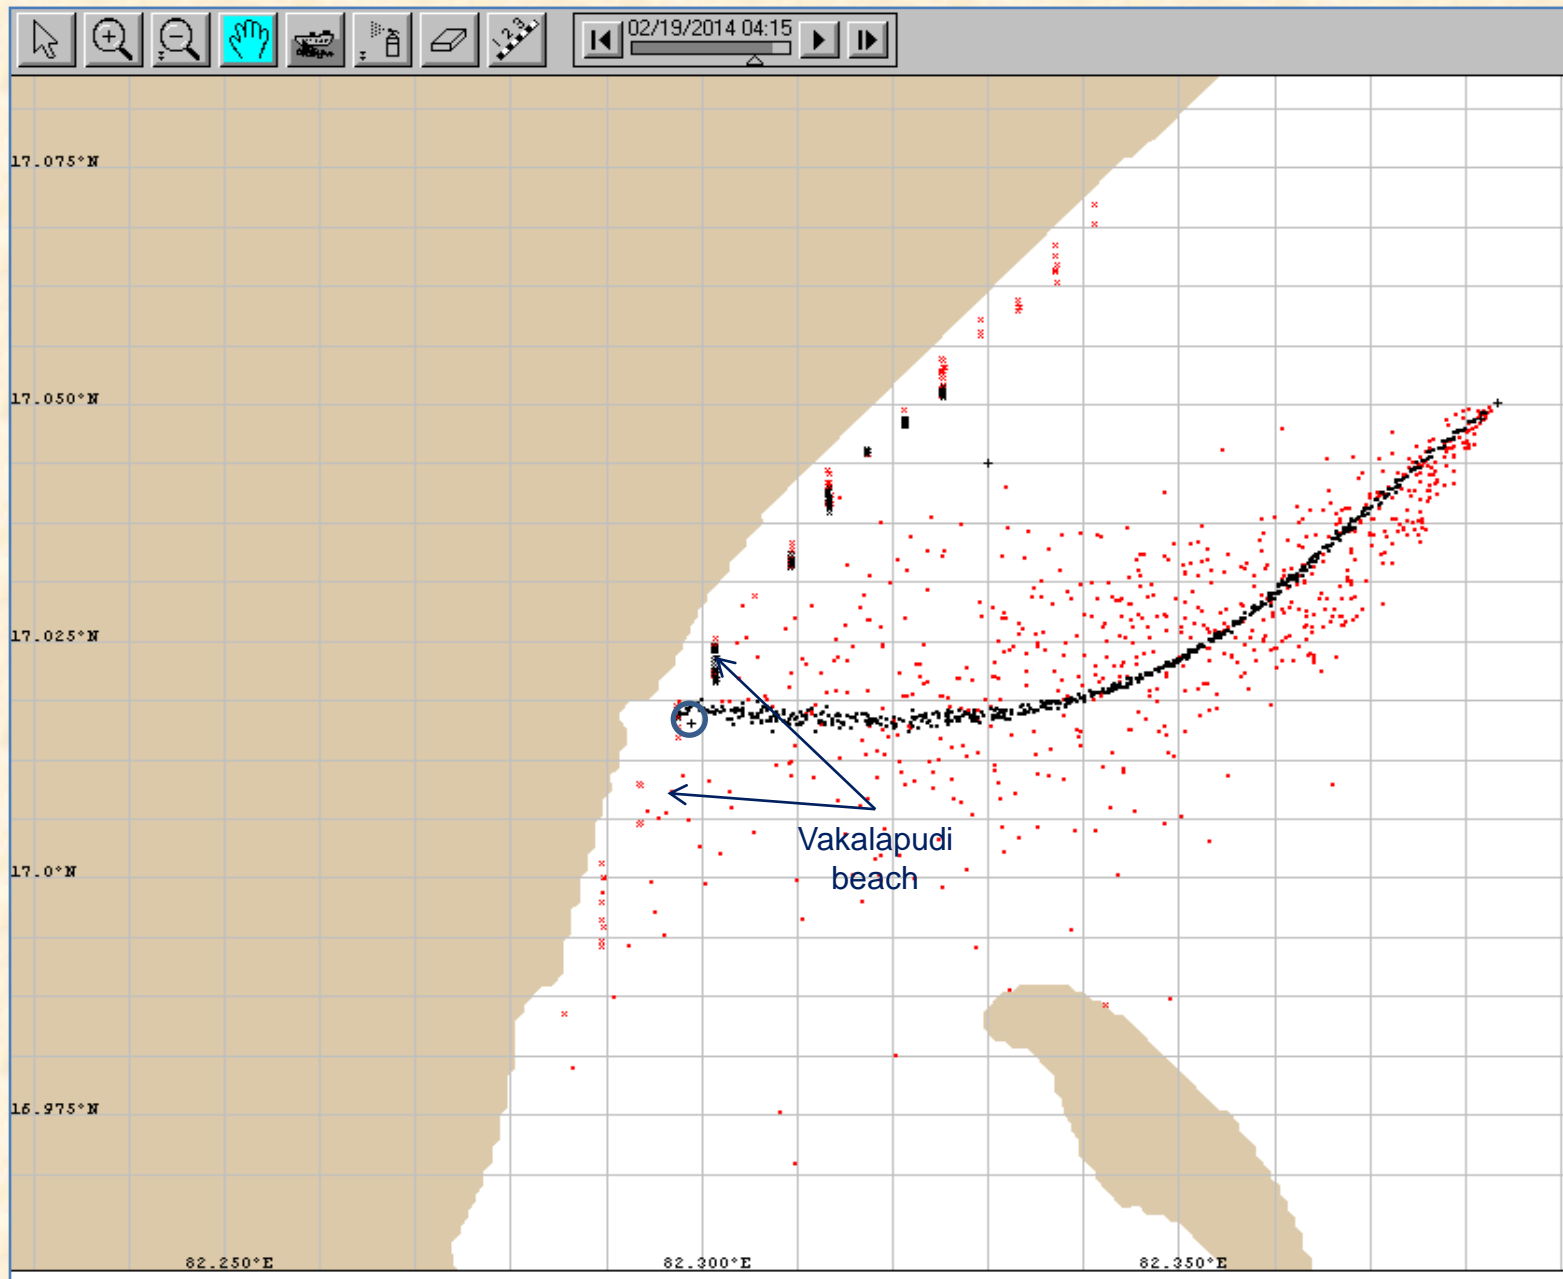

**Tug - Jala
Hamsa**

**Lewek Harrier (Oil Spill
Response Vessel)**

POSITION OF THE HUSK ON PHOTO BY 11.15 HRS, 18022014

PREDICTED POSITION OF THE HUSK BY 04.15 HRS, 19022014

Traces of rice husk sighted on Vakalapudi beach – 19 Feb 14

(After 06.00 am)

SAMPLE OUTPUT OF GNOME

THANK YOU

The ***Deepwater Horizon* oil spill** (also referred to as the **BP oil spill**, the **BP oil disaster**, the **Gulf of Mexico oil spill**, and the **Macondo blowout**) began on 20 April 2010 in the [Gulf of Mexico](#) on the [BP](#)-operated [Macondo Prospect](#). It claimed eleven lives^{[6][7][8][9]} and is considered the largest accidental marine [oil spill](#) in the history of the petroleum industry, an estimated 8% to 31% larger in volume than the previously largest, the [Ixtoc I oil spill](#). Following the [explosion and sinking of the *Deepwater Horizon* oil rig](#), a sea-floor [oil gusher](#) flowed for 87 days, until it was capped on 15 July 2010.^{[8][10]} The US Government estimated the total discharge at 4.9 million barrels (210 million US gal; 780,000 m³).^[3] After several failed efforts to contain the flow, the well was declared sealed on 19 September 2010.^[11] Some reports indicate the well site continues to leak.^{[12][13]}

Diffusion refers to the process by which molecules intermingle as a result of their kinetic energy of random motion

advection is a transport mechanism of a substance or conserved property by a fluid

NEST – PROCESSING STAGES

- The data processing includes the major steps like preprocessing, land sea masking, dark spot detection and finally clustering & determination.
- The dark spots are detected using an adaptive thresholding method which involves the detection of the pixels that has lower values than the threshold shift set.
- Pixels detected as part of the dark spot are clustered and then eliminated based on the dimension of the cluster and user selected minimum cluster size.
- The obtained oil spill signatures are taken for the comparison. The spill trajectory and the oil spill signatures are exported to a common platform for the ease of comparison.

CRITERIA FOR OIL SPILL SIGNATURE

The probability of oil spill is increased

- if the surrounding areas are homogeneous
- if the contrast between the slick and the neighboring region is high
- when the dissimilarity between the dark slick and the surrounding area is high

the probability of look-alikes is increased

- if the surrounding areas are heterogeneous.
- if the contrast between the slick and the neighboring region is low
- when the dissimilarity between the dark slick and the surrounding area is low.
